conservation behavior assists the investigation of species endangerment associated with managing animals impacted by anthropogenic activities it employs a theoretical framework that examines the mechanisms development function and phylogeny of behavior variation in order to develop practical tools for preventing biodiversity loss and extinction developed from a symposium held at the international congress on conservation biology in 2011 this is the first book to offer an in depth logical framework that identifies three vital areas for understanding conservation behavior anthropogenic threats to wildlife conservation and management protocols and indicators of anthropogenic threats bridging the gap between behavioral ecology and conservation biology this volume ascertains key links between the fields explores the theoretical foundations of these linkages and connects them to practical wildlife management tools and concise applicable advice adopting a clear and structured approach throughout this book is a vital resource for graduate students academic researchers and wildlife managers

behavioural ecologists study how animals maximize their genetic representation whilst conservation biologists study small populations attempt to prevent species extinctions this volume attempts to link these disciplines formally

the study of animal behaviour particularly from evolutionary and ecological viewpoints has been one of the major growing points in biology over the last 10 to 15 years the degree of quantitative rigour in theoretical observational and experimental approaches to behaviour has increased dramatically as more of the rapidly growing research literature becomes a basic requirement for students reading animal behaviour at undergraduate level there is a need for

a readily comprehensible text covering all major aspects of behaviour study to accompany their courses this book based on my first second and third year undergraduate lectures at the University of Nottingham is designed to meet that requirement the book begins with a discussion of the physiological and anatomical bases of behaviour the relationship between nervous system structure and function and behaviour hormonal effects on behaviour biological clocks perceptual mechanisms and stimulus filtering this leads to a consideration in chapter 2 of how the animal integrates internal and external stimuli in making decisions about its behaviour and the way natural selection has shaped decision making processes and the organisation of motivation the first two chapters therefore deal with the instigation or causation of behaviour within the animal chapters 3 and 4 deal with developmental aspects of behaviour chapter 3 discusses behaviour genetics including the relationship between specific genes and behaviour the heritability of behaviour patterns the site of gene action in the body and the evolutionary consequences of a genetic basis to behaviour

the book combines traditional approaches to behavioral ecology with ideas about self organization and complex systems from physics and mathematics

throughout their lives animals must complete many tasks including finding food avoiding predators attracting mates and navigating through a complex and dynamic environment consequently they have evolved a staggering array of sensory organs that are fundamental to survival and reproduction and shape much of their evolution and behaviour sensory ecology deals with how animals acquire process and use information in their lives and the sensory systems involved it investigates the type of information that is gathered by animals how it is used in a range of behaviours and the evolution of such traits it deals with both mechanistic questions e.g. how sensory receptors capture information from the environment and how the physical attributes of the environment affect information transmission and functional questions e.g. the adaptive significance of the information used by the animal to make a decision recent research has dealt more explicitly with how sensory systems are involved with and even drive evolutionary change including the formation of new species sensory ecology behaviour and evolution provides a broad introduction to sensory ecology across a wide range of taxonomic groups covering all the various sensory modalities e.g. sound visual chemical magnetic and electric relating to diverse areas spanning anti predator strategies foraging mate choice navigation and more with the aim being to illustrate key principles and differences this accessible textbook is suitable for senior undergraduates graduate students

and professional academics taking courses or conducting research in sensory ecology biology neuroethology behavioural and evolutionary ecology communication and signalling it will also be of relevance and use to psychologists interested in sensory information and behaviour

this book describes a powerful and flexible technique for the modeling of behavior based on evolutionary principles the technique employs stochastic dynamic programming and permits the analysis of behavioral adaptations wherein organisms respond to changes in their environment and in their own current physiological state models can be constructed to reflect sequential decisions concerned simultaneously with foraging reproduction predator avoidance and other activities the authors show how to construct and use dynamic behavioral models part i covers the mathematical background and computer programming and then uses a paradigm of foraging under risk of predation to exemplify the general modeling technique part ii consists of five applied chapters illustrating the scope of the dynamic modeling approach they treat hunting behavior in lions reproduction in insects migrations of aquatic organisms clutch size and parental care in birds and movement of spiders and raptors advanced topics including the study of dynamic evolutionarily stable strategies are discussed in part iii
